

IN THE CLAIMS

Please amend the claims as follows:

Claim 1 (Currently Amended): An optical writing unit, comprising:

a light emitting device array ~~that further comprises~~ comprising a plurality of light emitting device array chips, each of ~~which comprises~~ the light entity device array chips comprising a plurality of light emitting devices that are arranged at a predetermined interval  $P[[,]]$ ; and

an image forming device array ~~that further comprises~~ comprising a plurality of image forming devices,

wherein light volume of the light emitting devices is set up such that a predefined property value concerning an exposure intensity distribution of each of the light emitting devices falls within a predetermined range, the predetermined range being defined for an effective image area in its entirety, and

the light volume of the light emitting devices that are located on and near an edge of the light emitting device array chip can be set differently from other light emitting devices.

Claim 2 (Original): The optical writing unit as claimed in claim 1, further comprising operating process means for setting up the light volume for each of the light emitting devices to irradiate, wherein each of the light emitting devices is driven based on the light volume set up by the operating process means.

Claim 3 (Original): The optical writing unit as claimed in claim 2, wherein the operating process means are arranged for acquiring a correlation between the light volume

and the property value for each of the light emitting devices, based on a result of measuring the property value corresponding to the light volume.

Claim 4 (Currently Amended): The optical writing unit as claimed in claim 2, wherein the operating process means are arranged for acquiring the range of the property value that the light emitting device ~~should take~~ takes, based on the property values ~~of the light volumes~~ of a plurality of the preceding light emitting devices.

Claim 5 (Original): The optical writing unit as claimed in claim 2, wherein the operating process means are arranged for determining the light volume of each of the light emitting devices using a compensation value for a driving current.

Claim 6 (Canceled).

Claim 7 (Currently Amended): The optical writing unit as claimed in claim 1, wherein the light volume of the light emitting devices that are located on and near the edge of the light emitting device array chips is set up ~~in the case~~ such that an interval  $P_a$  between one of the light emitting devices on the edge of one of the light emitting device array chips and another one of the light emitting devices on the edge of an adjacent one of the light emitting device array chips is different from the predetermined interval  $P$  and such that ~~by more than 10%, namely, in the cases of~~  $P_a > 1.1P$  ~~[[and]]~~ or  $P_a < 0.9P$ .

Claim 8 (Original): The optical writing unit as claimed in claim 1, wherein the property values of more than  $M/2$  of the light emitting devices that are located on and near

the edge of each of the light emitting device array chips are measured, when the property values of a total of M of the light emitting devices are measured.

Claim 9 (Currently Amended): An image forming apparatus for forming an image, comprising:

an exposure unit ~~that further comprises~~ comprising an image forming device array and a light emitting device array ~~that further comprises,~~ the light emitting device array comprising a plurality of light emitting device array chips, each ~~of which comprises~~ light emitting device array chip comprising a plurality of light emitting devices,

wherein light volume of the light emitting devices is set up such that a predefined property value concerning an exposure intensity distribution of each of the light emitting devices, which correspond to an effective image area in its entirety, falls within a predetermined range, and

the light volume of the light emitting devices that are located on and near an edge of the light emitting device array chip can be set differently from the other light emitting devices.

Claim 10 (Currently Amended): A driving method of an optical writing unit ~~that comprises~~ comprising an image forming device array and a light emitting device array ~~that further comprises,~~ the light emitting device array comprising a plurality of light emitting device array chips, each ~~of which comprises~~ the light emitting device array chips comprising a plurality of light emitting devices, the image forming device array comprising a plurality of image forming devices, the driving method comprising:

setting ~~wherein~~ light volume of the light emitting devices ~~is set up~~ such that a predefined property value concerning an exposure intensity distribution of each of the light

emitting devices, which correspond to an effective image area in its entirety, falls within a predetermined range,

~~and wherein~~ the light volume of the light emitting devices ~~that are~~ located on and near an edge of the light emitting device array chip ~~can be~~ are set near ~~[[a]]~~ an upper limit or a lower unit of the predetermined range.

Claim 11 (Currently Amended): An optical writing unit, comprising:

a light emitting device array ~~that comprises~~ comprising a plurality of light emitting device array chips, each of ~~which comprises~~ the light emitting device array chips comprising a plurality of light emitting devices that are arranged at a predetermined interval  $P[,]$ ; and

an image forming device array ~~that further comprises~~ comprising a plurality of image forming devices,

wherein light volume of the light emitting devices is set ~~up~~ such that a gradient of an approximated ~~regression~~ line for exposure areas corresponding to a plurality of the light emitting devices that are selected at a predefined cycle falls within a predetermined range, the predetermined range being defined for an effective image area in its entirety, and

the light volume of the light emitting devices that are located on and near an edge of the light emitting device array chips are set up such that said gradient corresponds to an interval  $P_a$  between the light emitting device on the edge of one of the light emitting device array chips and the light emitting device on the edge of an adjacent one of the light emitting device array chips.

Claim 12 (Original): The optical writing unit as claimed in claim 11, wherein the predefined cycle is a constant throughout the light emitting device array.

Claim 13 (Original): The optical writing unit as claimed in claim 12, wherein one cycle of the predefined constant cycle comprises  $M+N$  of the light emitting devices, where  $M$  represents the number of the light emitting devices that are selected,  $N$  represents the number of the light emitting devices that are not selected, and  $M$  is equal to or less than  $N$ .

Claim 14 (Currently Amended): The optical writing unit as claimed in claim 11, wherein the predetermined interval  $P$  of the light emitting devices is set equal to  $1/10$  or less than  $1/10$  of ~~the~~ an interval of the image forming devices.

Claim 15 (Currently Amended): The optical writing unit as claimed in claim 11, wherein the approximated ~~regression~~ line of the exposure areas corresponding to the plurality of light emitting devices is obtained from a plurality of the light emitting devices that are located within a range between  $LK$  and  $3LK$ , where  $LK$  represents ~~the~~ an interval of the image forming devices.

Claim 16 (Currently Amended): The optical writing unit as claimed in claim 11, wherein intervals between the light emitting device on the edge of one of the light emitting device array chips and the light emitting device on the edge of an adjacent one of the light emitting device array chips  $[[,]]$  are categorized into a plurality of ranks based on the magnitude of the intervals, and the light volume of each of the light emitting devices is set up according to said ranks.

Claim 17 (Currently Amended): The optical writing unit as claimed in claim 16, wherein ~~said ranks comprise three ranks, namely,~~ the ranks are  $Pa < PL$ ,  $PL \leq Pa \leq PH$ , and

$PH < Pa$ , where  $Pa$  represents the interval between the light emitting device on the edge of one of the light emitting device array chips and the light emitting device on the edge of an adjacent one of the light emitting device array chips, and  $PL$  and  $PH$  represent predetermined threshold levels of the interval, where  $PL < PH$ .

Claim 18 (Original): The optical writing unit as claimed in claim 17, wherein the light volume is increased where  $Pa > PH$ , and the light volume is decreased where  $Pa < PL$ .

Claim 19 (Currently Amended): The optical writing unit as claimed in claim 17, wherein  $PL$  is set at  $0.9P$ , and  $PH$  is set at  $1.1P$ , ~~where  $P$  represents the predetermined interval of the light emitting devices.~~

Claim 20 (Original): The optical writing unit as claimed in claim 11, wherein the light emitting devices that are located on and near an edge of the light emitting device array chip are the light emitting devices that correspond to a range of distances between  $0.5LK$  and  $1.5LK$ , where  $LK$  represents the interval of the image forming devices.

Claim 21 (Currently Amended): An image forming apparatus for forming an image, comprising:

an exposure unit ~~that further comprises~~ comprising an image forming device array and a light emitting device array, the light emitting device array comprising a plurality of light emitting device array chips, each of ~~which comprises~~ the light emitting device array chips comprising a plurality of light emitting devices arranged at a predetermined interval,

wherein the light volume of each of the light emitting devices is set up such that ~~[[the]] a gradient of an approximated regression~~ line of exposure areas corresponding to a

plurality of the light emitting devices that are selected based on a predetermined cycle falls within a predetermined range for an effective image domain in its entirety, and

the light volume of each of the light emitting devices on and near the edge of the light emitting device array chip is set up such that said gradient corresponds to an interval between the light emitting device on the edge of one of the light emitting device array chips and the light emitting device on the edge of an adjacent one of the light emitting device array chips.

Claim 22 (Currently Amended): A driving method for driving an optical writing unit comprising an exposure unit ~~that further comprises, the exposure unit comprising an image forming device array and~~ a light emitting device array, the light emitting device array comprising a plurality of light emitting device array chips, each of which comprises the light emitting device array chips comprising a plurality of light emitting devices arranged at a predetermined interval, the image forming device array comprising a plurality of image forming devices, the driving method comprising:

setting wherein the light volume of each of the light emitting devices ~~is set up~~ such that ~~the~~ a gradient of an approximated ~~regression~~ line of exposure areas corresponding to a plurality of the light emitting devices that are selected based on a predetermined cycle falls within a predetermined range for an effective image domain in its entirety, and

wherein the light volume of each of the light emitting devices on and near the edge of the light emitting device array chip is set up such that said gradient corresponds to an interval between the light emitting device on the edge of one of the light emitting device array chips and the light emitting device on the edge of an adjacent one of the light emitting device array chips.
